                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       It was changed to TrT to restore the reading frame of gene V. Mi3mplOa contains two amber mutations in gene I and gene II. These mutations are not presented in this sequence. In Mi3mplOw the mutations have been reverted to wildtype.

AAV12871;
```

```
This sequence represents the MI3 sequence identified using the primer shown in AAV12871 labelled with a dye of the invention. The dye is an cenergy transfer dyes of formula D-R21-Z1-C0-R22-R38-A (I), where:

D is a donor dye that absorbs light at a first wavelength and emits excitation energy in response; A is an acceptor dye that absorbs the excitation energy from D and fluoresces at a second wavelength in response; Z1 = NH, So T 0; R21 = 1-5C alkylene; R22 = an alkene, diene captoring group, an unsaturated 5- or Gemembered ring or a linker to the acceptor dye. R28 is especially R29-Z2-C0, where R29 = 1-5C alkylene and Z2 - NH, So T 0. The dyes are used for labelling concleosides, nucleosides, nucleoside mono-, di- and triphosphates, oligonucleotides and oligonucleotide analogues, especially for labelling oligonucleotide analogues, especially for labelling oligonucleotide concludes used for nucleic acid sequencing. The dyes alone.
                         Example 5; Page 54-55; 79pp; English.

New energy transfer dye, used in nucleic acid sequencing Disclosure; Column 85-88; 77pp; English.

This invention describes a novel energy transfer dye (I) which comprises a donor dye which is capable of absorbing light at a first wavelength and emptiting excitation energy in response, and an acceptor dye which is capable of absorbing the excitation energy emitted by the donor and fluorescing at a second wavelength. (I) are used in processes for sequencing nucleic acids. (I) can be used in a wide variety of methods for detecting the presence of a component in a sample by labeling the component with (I). They are especially useful in processes which combine separation with fluorescent detection techniques, particularly methods requiring the simultaneous detection of multiple spatially overlapping analytes. (I) have a strong fluorescent signal, the orientation between the donor and acceptor fluorophores is such that the energy is efficiently transferred between them. This sequence represents a fragment to Bacteriophage M13 DNA which is used to describe the method of the

mGP1-2 encodes T7 RNA polymerase under the control of the lac promoter. Plasmid mGP1-2 can coexist in the same host cell as plasmids pTxx.2 and pGP5-5 and can be used to regulate the prodn. of T7 DNA polymerase from pGP5-5 simply by causing prodn. of T7 RNA polymerase by inducing the lac promoter with, eg isopropyl beta-D-thiogalactoside. IPPG also induces the tac promoter of pTxx-2, causing prodn. of thioredoxin.

```
mGP1-2 encodes T7 RNA polymerase under the control of the lac promoter. Plasmid mGP1-2 can coexist in the same host cell as plasmids pTrx-2 and pGP5-5 and can be used to regulate the prodn. of T7 DNA polymerase from pGP5-5 simply by causing prodn. of T7 RNA polymerase by inducing the lac promoter with, eg isopropyl beta-D-thiogalactoside. IPTG also induces the tac promoter of pTrx-2, causing prodn. of thioredoxin.

                                                                                                                                                                                                                                                                    randomised oligonucleotides. MilmpB was the starting vector which was modified to contain, in addition to the encoded wild-type Mil gene VIII larguence with a stop codon placed between it and an EcoRISACI cloning site for randomised oligonucleotides; a pair of FokI sites to be used for joining with Millix12, the left-hand vector; a second stop codon placed on the opposite side of the vector than the portion being combined with the left-half vector; and various other mutations to remove redundant restriction sites and the N-terminal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               5567
                                                                                                                                      MI3IX421 is identical to vector MI3IX42 (AAQ66626) except that the amber codon between the EcoRI-SacI cloning site and the pseudo-wild type gene VIII sequence was removed. This change ensures that all expression off the Lac2 promoter produces a peptide-gene VIII fusion protein. The vector was used for the construction of right half oligonucleotide libraries.
                                                                                                                                                                                                                                                                                                                          0; Gaps

The sequences given in AAQ24173-5 are vectors which allow the expression of random peptides on the surface of M13. The vectors are produced by combining separate vectors into a single larger vector. This system produces random oligonucleotides functionally linked to expression
                                                                                                                                                                                                  5207

product. This gene encodes the wild-type MI3 gVIII amino acid sequence but has been changed at the nucleotide level to reduce homologous recombination with the wild-type gVIII contained on these vectors. The wild-type gVIII contained on these vectors. The wild-type gVIII is present to ensure that at least some functional, non-fusion coat protein is produced. They also contain the expression elements for the peptide fusion proteins. A ribosome binding site and LacZ promoter/operator elements are present for transcription and translation of the peptide fusion proteins. Various restriction sites are present for the cloning of random peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5627

sednences

The sequences given in AAQ24170-2 are vectors which allow the expression of random peptides on the surface of M13. The vectors are produced by combining separate vectors into a single larger vector. This system produces random oligonucleotides functionally linked to expression elements and to gVIII. M131X42 is used for sense strand oligonucleotide portions. It encodes a pseudo-wild type gVIII product. This gene encodes the wild-type M13 gVIII amino acid homologous recombination with the wild-type gVIII contained on the same vector. The wild-type gVIII is present to ensure that at least some functional, non-fusion coat protein is produced. M131X22 is used

It contains the expression elements for the peptide fusion proteins. A ribosome binding site and Lacz promoter/operator elements are present for transcription and translation of the peptide fusion proteins. M11 contains a wild-type and pseudo-wild-type gVIII genes and various restriction sites for cloning of random peptides. 184 AATTGCGTTGCGCTCACTGCCCGCTTTCCAGTCGGGAAACCTGTCGTGCCAGCTGCATTA 244 ATGAATCGGCCAACGCGGGGGGGGGGGTTTGCGTATTGGCCGCCAGGGTGGTTTTTC 304 TTTTCACCAGTGAGGGGAACAGCTGATTGCCCTTCACCGCCTGGCCCTGAGAGGTT 94.0%; Score 1144.4; DB 13; Length 7294; 99.5%; Pred. AAF59234/C
```

The present invention describes a method for producing, in vitro, copies of a specific nucleic acid. The process does not require the use of intermediate structures for the production of the nucleic acid. The method comprises: (a) providing a nucleic acid sample containing the specific sequence; (b) contacting the sample with a mixture containing: (i) nucleic acid precursors; (ii) specific nucleic acid primers, each complementary to a distinct region of the sequence; and (iii) a nucleic acid producing catalyst; and (c) allowing the mixture to react under isostatic conditions of temperature, buffer and ionic strength. The method can be used for producing copies of specific nucleic acids in vitro. The process can be used to determine if a specific target nucleic acid was derived from a living or deceased organism. The present sequence represents a Mi3mpl8 nucleotide sequence which is given in the

The present sequence is a modified filamentous phage used for modulation of polypeptide display on the surface which permits facile manipulation of the valency of display. The gene encoding the polypeptide is fused into a synthetic copy of a major coat protein (MCP) which enables incorporation into the phage during assembly of the filament. Modified leaky inducble promoter; a synthetic MCP gene; and a directional cloning site for receiving a nucleotide insert. The vectors can be used for the expression of polypeptides such as ligand-binding heterodimeric characterising antibodies.

Lie tretrougher to perserve the interminant of the control of the timmunoglobulin superfamily, the second vector having two pairs of restriction sites symmetrically oriented about a cloning site in an identical orientation to that of the first vector, where polypeptides encoded by the first and second gene families are known to form the combining the vector sequences produced by steps (a) and (c) combining the vector sequences produced by steps (a) and (b) under sequences containing the first and second populations of the vector sequences containing the first and second populations of diverse DNA sequences. The method is used to produce diverse populations of antibodies or r-cell receptors for diagnostic or therapeutic purposes.
This sequence represents a M13-based vector constructed using the method of the invention, and the primers shown in AAV03629-V03649. The method of the invention is for constructing a diverse population of vectors capable of expressing diverse populations of first and second polypeptides which form a diverse population of heteromeric receptors of the immunoglobulin superfamily, and comprises: (a) perstationally linking to a first vector a first population of diverse DNA sequences within a first gene family encoding a diverse population of first polypeptides of the heteromeric receptor of the immunoglobulin superfamily, the first

Especially mentioned, the cell may be a bacteriophage, where the receptor protein are expressed as fusion proteins with the surface protein gyll: This sequence represents the plasmid M13IX11 which is used for expression of the light chain proteins. The plasmid is constructed using primers AAX16338-XI6952. The methods can be used to generate diverse populations of heteromeric receptors which mimic the natural immune system and can be used for diagnostic and therapeutic purposes.

the present invention describes a kit (I) for the preparation of vectors for the coexpression of two or more DNA sequences encoding polypeptides comprising two vectors which operatively combine through two pairs of restriction sites to form a single vector. The kit is useful for the restriction of vectors for the coexpression of two or more DNA sequences encoding polypeptides which from heteromeric receptors. The kit simply and efficiently generates a large repertoric of diverse combinations of heteromeric receptors. Only proper combinations of vector portions are randomly brought together for the coexpression of different DNA sequences without loss of population size or diversity. AASJ91524 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              constructed in the exemplification of the present invention. AAZ91529 to AAX91599 represent oligonuclectides used in the construction of vectors in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Kit for the preparation of vectors for the coexpression of two or more DNA sequences encoding proteins that form heteromeric receptors -
Bacteriophage M13 vector; prokaryotic cell; heteromeric receptor; antibody; immune system; filamentous bacteriophage; cloning; screening; coexpression; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 7317 BP; 1787 A; 1555 C; 1547 G; 2428 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Direct Submission

Submitted (15-SEP-2000) Trypanosoma brucei genome sequencing project. Sanger Center, The Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 ISA, E-mail: barrell@sanger.ac.uk and nhl@sanger.ac.uk
nhl@sanger.ac.uk
nhl@sanger.ac.uk
constructed at the Institute for Genomic Research (TIGR),
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TRED927/4 GUTAt 10.1) was mechanically sheared
to give a tight size distribution ( the library construction is
4 kb). The v+i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  T. brucei sheared genomic DNA clone 2908, forward sequence, similar to AR036903 AR036903 Sequence 1 from patent US 5800996. . . ., N-1907, Prob-5.1e-151, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Email: nelsayed@tigr.org

Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.isstate.edu' and follow the links for 'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI

Note-"Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site_1: BamHI; Site_2: BgIII; RescueMu is a 4.9 kb, modified maize Mu transposon. designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.isatate.edu' and follow the links for 'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BiglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with
